Windows 95* Instructions on Setting up Dial-up to Arrownet

These are instructions on how to set up your personal machine at home so you can get access to the Internet via Arrownet. Dispelling any rumors you may have heard this connection is only Internet. You will not be able to access any of the programs located in your office or in the computer labs nor will you have access to your “h:” drive.

To do this you need a modem (that is installed and functional), and have dial-up networking installed on your machine. It would not be a bad idea to have your Windows 95 disk handy.

Note: If you have had Internet service before through an ISP (Internet Service Provider) i.e. Southwest Connect, AOL, etc., you may want to uninstall Internet Explorer. After you are done setting up you dialup, reinstall Internet Explorer. Warning: Do not do this if you have Windows 98.

Installing Dial-up Networking

First open My Computer and see if there is an icon called “Dial-up Networking”. If there is you can skip the following steps and go on to “Installing Dial-Up Adapter and TCP/IP”.

If there is no icon:

Click the Start button located on your Task Bar
Choose Settings, then Control Panel

![Control Panel Window]

Inside Control Panel, double click on Add and Remove Programs icon

When the next window appears, click the Setup tab
From the list that appears choose Communications
Click on Details and put a check in the box for Dial-up Networking
Now click on OK, then click on OK again
At this point you may need your Windows 95 CD. Reboot you PC
Install Dial-Up Adapter and TCP/IP

Open **Control Panel** and double click **Network** Icon

When the window appears under Configurations, Click on **Add**
Then double click on **Adapter** from the list

Scroll down and click **Microsoft** from the list and then highlight **Dial-Up Adapter**
Click **OK**, the click then **Add** again

Now double click on **Protocol**.

Choose **Microsoft** from the list, and then highlight **TCP/IP**
Now click **OK**
Click the **OK** button at the bottom of the window
You may need your Windows 95 CD at this point. Reboot your PC.

**Configuring your Connection**

Go to the **Start** button, choose **Programs**
Choose **Accessories**, choose **Dial-up Networking**

In the window that comes up, double click on the icon that says, **“Make a Connection”**

A window will appear, it will ask you to name the connection and choose your modem.
Click Next

Make sure the right area code is entered and the right country code. The phone number for dial-up is **793-6900**.
Then click **Finish**.

**Making a connection**

Double click the icon that was created and a login screen appears

It will ask for your username and password. (the user names are the first seven letters of your last name, plus your first initial. And the password is the same one you use to login to mail.mcm.edu) Then click ok.
*Setting up dial-up on other operating systems (i.e. Windows 98, Windows NT 4.0) should basically be the same as the Windows 95. If you have any trouble use the help feature that comes with Windows. Other Non Microsoft OS (i.e. Mac OS, and Linux) you will need to look at your software documentation for further instructions.
